2020 | Sexually Transmitted Infections Data Brief

Key Findings from 2018 Guilford County Sexually Transmitted Infection Data

A note on data in this report: The processing of STI data records may results in a delay in public data availability. Published STI data may change with further follow-up and investigation.

- In 2018, the most commonly-occurring sexually-transmitted infection in Guilford County was chlamydia, followed by gonorrhea with 5,162 and 1,965 new cases respectively.
- HIV Infection incidence rates declined in 2017 and 2018, but the county still has higher rates than most peer counties and the state.
- Primary and secondary syphilis incidence rates declined from 23.2 cases per 100,000 in 2015 to 16.3 in 2018.
- Chlamydia incidence rates continued an upward trend, reaching a high of 967.3 cases per 100,000 in 2018.
- Gonorrhea rates climbed to 368.5 per 100,000, a level not seen since 2007.
- Increasing rates of chlamydia, gonorrhea and syphilis are consistent with state and national trends.

Sexually Transmitted Infections

Chlamydia is the most common sexually transmitted infection. Chlamydia can infect both men and women. It can cause serious, permanent damage to a woman's reproductive system, which can make future pregnancies impossible. Chlamydia can also cause a potentially fatal ectopic pregnancy, which occurs outside the womb.

Gonorrhea is a common infection transmitted by sexual contact, characterized by inflammation of the mucous membranes of the genital and urinary tracts, an acute discharge containing pus, and painful urination, especially in men. Women often have few or no symptoms, but pregnant women can transmit the infection to their baby during delivery, causing serious health problems for the baby.

Human Immunodeficiency Virus (HIV) is a virus that attacks the body's immune system, making the person more likely to get other infections or infection-related cancers. If untreated, HIV can lead to **Acquired** Immunodeficiency Syndrome (AIDS), a potentially fatal condition.

Syphilis is a sexually transmitted infection that can cause serious health problems if not treated. Syphilis is divided into stages—primary, secondary and latent—with different signs and symptoms associated with each stage.

Non-Gonococcal Urethritis (NGU) is inflammation of the urethra not caused by gonorrhea. NGU can result from various infectious and non-infectious conditions.

Pelvic Inflammatory Disease (PID) is an infection of female reproductive organs. It is a complication often caused by some STIs such as chlamydia and gonorrhea. Other infections that are not sexually transmitted can also cause PID.

Hepatitis A, Hepatitis B and **Hepatitis C** are potentially serious liver infections caused by three different viruses. Hepatitis A is usually transmitted by ingestion of contaminated food or water, while Hepatitis B and C are typically transmitted though contact with infectious body fluids.

¹ Newly diagnosed HIV rates among adults and adolescents age 13 and above. Rates based on that population.

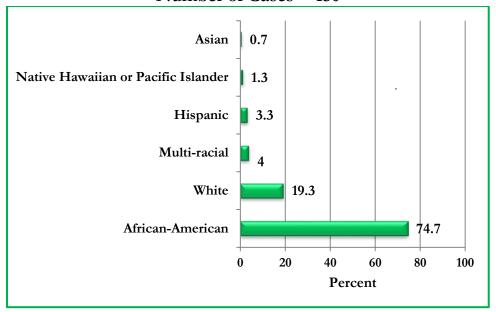

Sexually Transmitted Infections: Syphilis

Primary, Secondary and Early Latent Syphilis Rates per 100,000 By Selected Counties and NC, 2014-2018

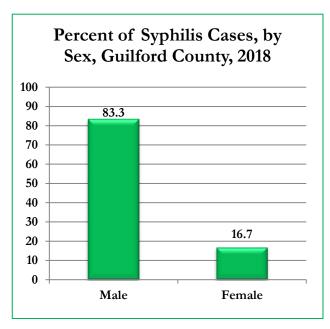

Geographic Area	2014	2015	2016	2017	2018
Cumberland	23.0	35.8	27.6	24.0	35.2

Sexually Transmitted Infections: Chlamydia

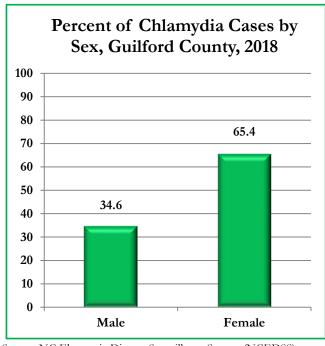

Characteristics of Guilford County Chlamydia Cases and Rates by Race and Hispanic Status, 2016-2018

	2016		20	17	2018		
Race or Ethnicity Classification	Number of Cases	Percent of Cases	Number of Cases	Percent of Cases	Number of Cases	Percent of Cases	
American Indian	8	0.2%	3	0.01%	12	0.2%	
Asian	56	1.4%	48	1.0%	65	1.3%	
African-American	2,534	61.8%	2,952	62.4%	3,249	62.9.0%	
Hawaiian/Pacific	4	0.1%	3	0.1%	8	0.2%	
White	467	11.4%	579	12.2%	696	13.5%	
Other	105	2.6%	129	2.7%	155	3.0%	
Unknown	914	22.3%	929	19.6%	946	18.3%	
Multi-Racial	10	0.24%	11	0.2%	24	0.5%	
Missing	4	0.10%	77	1.6%	7	0.1	
Race Total	4,102	100%	4,731	100%	5,162	100%	
Hispanic*	153	3.7%	181	3.8%	237	4.6%	

^{*}Hispanics can be of any race.

Source: NC Electronic Disease Surveillance System (NCEDSS).

- The highest chlamydia incidence rates are among African-American residents, with large disparities compared to Whites and other race/ethnic groups.
- The age groups with the highest rates of chlamydia are ages 20-24, followed by ages 15-19 and ages 25-29.
- Two-thirds of chlamydia cases are among females. Chlamydia cases are diagnosed largely as a result of screening, and women are more likely to have screening tests.
